Google Cloud H2S

AI Builder Cup

Build in JAPAC.
Build for the world.

Team Details

a. Team name: **EveryOps**
b. Team leader name: **James Alein Ocampo**
c. Problem Statement: **Future of Work & Enterprise Productivity**

Brief about the idea

1 Every business runs on operations

Bookings, sales, stock, patients, bills and staff, every single day.

→

2 Operations need a system

Most small businesses run on group chats, spreadsheets and memory.

→

3 Systems are expensive

Custom software costs a fortune, takes months to build, and needs a developer every time something changes. Off-the-shelf apps force someone else's workflow.

EveryOps: describe your business, get the system that runs it.

Explain your business in your own words. Gemini on Vertex AI asks only what it needs, learns from similar systems shared by the community, and designs the pages, records and rules. EveryOps checks the design, then one shared engine runs it, with a website for your customers. Change anything by asking, and approve every change first.

Describe it. Shape it. Run it.

Opportunities

How is it different?

- **Other tools hand you software** and make your business fit into it.
- **Custom software is a new app** that costs a fortune, takes months, and needs a developer for every change.
- **We don’t make another app.** We build your system for you, the way your business already works.

How does it solve the problem?

- **Tell us how you work,** in your own words.
- **We build your system:** bookings, sales, stock, patients, bills, and a website for your customers.
- **When things change, just ask.** You see every change before it happens, and you can undo it.

Unique selling point

- **Your system, built from one conversation.** No developer, no months of waiting.
- **It learns from other businesses.** Gemini studies the systems owners share publicly, borrows what works, and builds yours better.
- **It keeps up with you.** Your system changes whenever your business does.

List of features offered by the solution

Ask EveryOps: workspace assistant

- **Answers from your data,** showing the records it used.
- **Changes by asking.** Preview, approve, and undo any time.
- **Memory.** Remembers your instructions and preferences.
- **Things to fix.** Spots problems and suggests fixes.
- **Point and attach.** Pick part of the page, or add photos, PDFs, spreadsheets or a voice note.

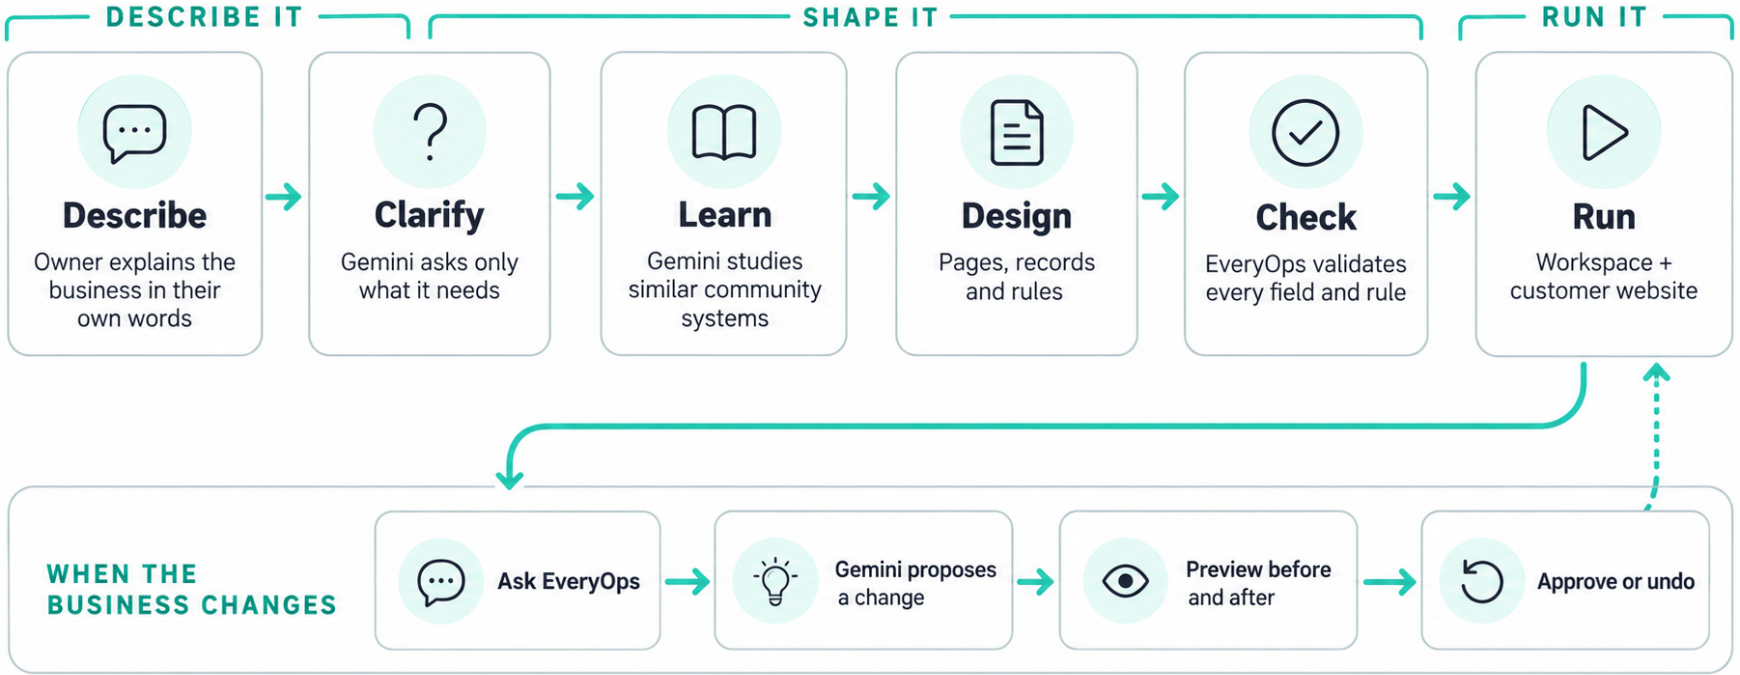

Setup from a conversation

- **Start from what you have.** Attach a menu photo, price list or spreadsheet, or just speak.
- **Asks only what it needs,** with tap-to-answer suggestions.
- **Learns from community systems** to build a better first draft.
- **Builds your pages, records, rules and dashboards** with sample data, checked before you create it.

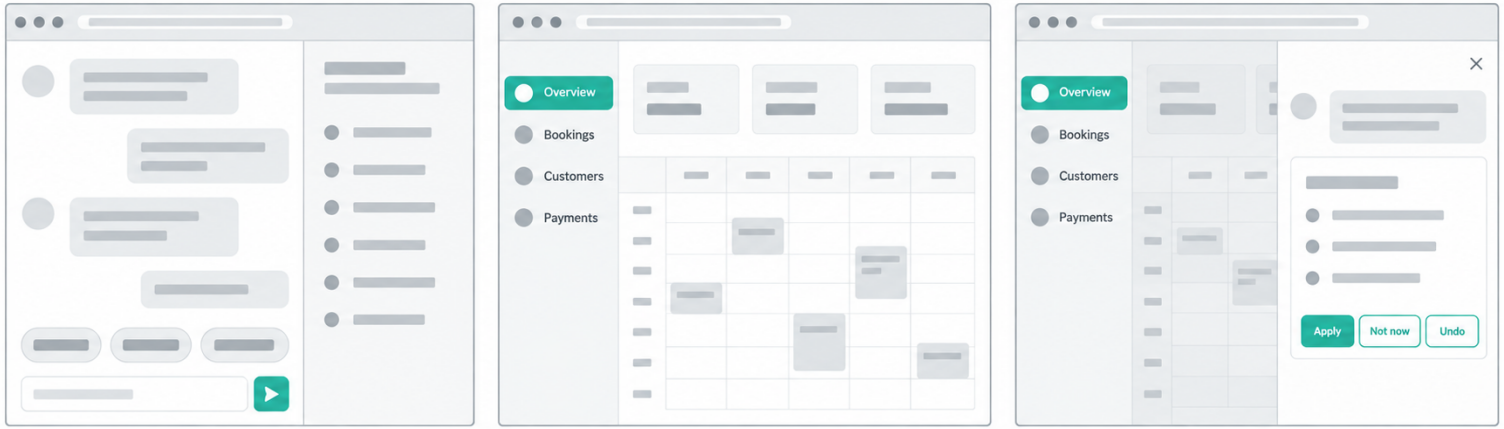

Public pages and community

- **Public pages.** Landing pages and booking or inquiry forms for customers, no account needed.
- **Custom pages.** Ask for any page design; it stays connected to your live data.
- **Community systems.** Publish your design while records stay private; others preview or copy it in one click.
- **Teams.** Owner, admin, staff and viewer roles.

Process flow diagram or Use-case diagram

Wireframes/Mock diagrams of the proposed solution (optional)

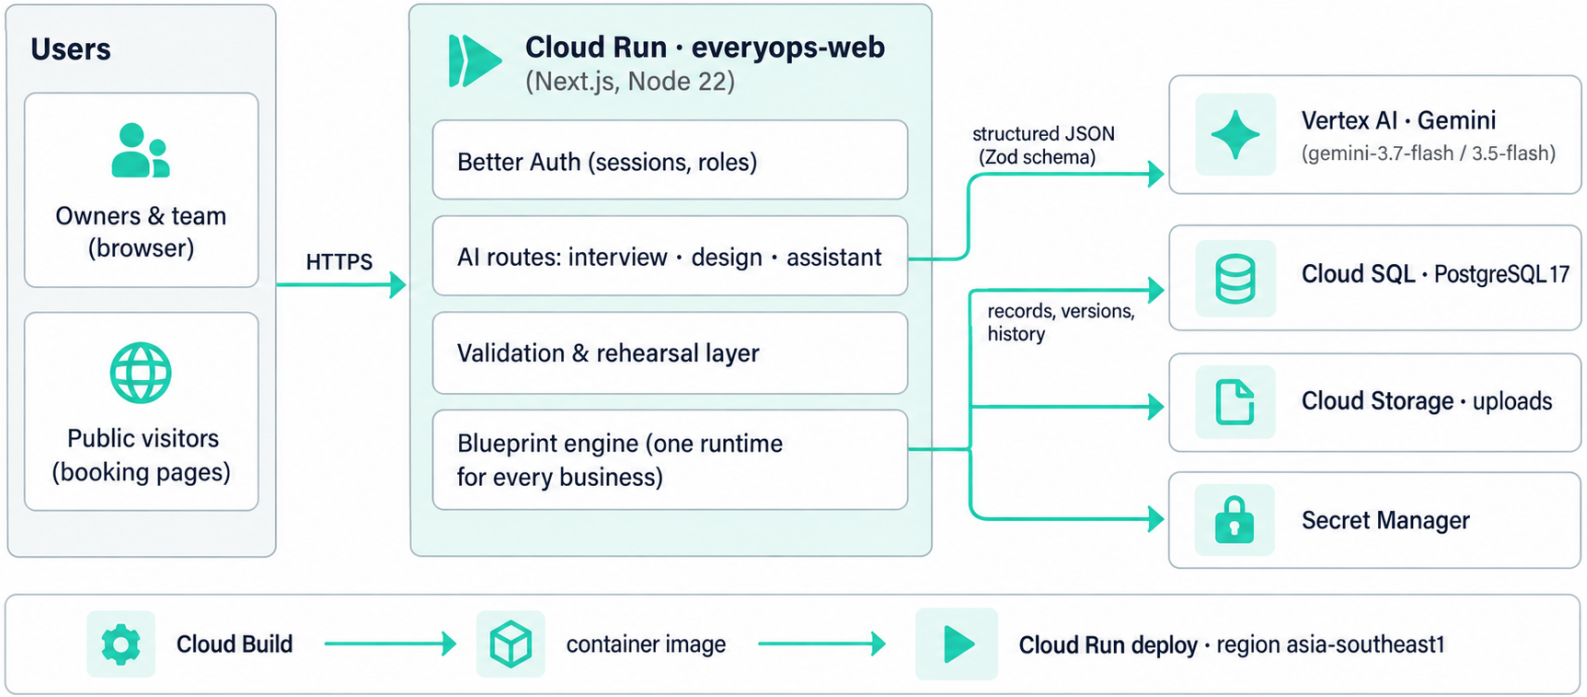

1. Setup interview

2. Generated workspace

3. Ask EveryOps change plan

Low-fidelity wireframes of the three core screens. Real screens from the demo video are on the snapshots slide.

Architecture diagram of the proposed solution

Technologies to be used in the solution

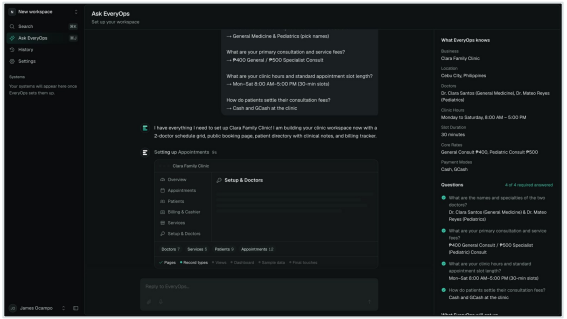

Layer	Technology	How EveryOps uses it
Generative AI	Gemini on Vertex AI (Gemini 3.7 Flash and 3.5 Flash)	Asks the setup questions, designs the blueprint, answers questions and proposes changes as structured JSON
Validation	Zod schemas, blueprint validator, rehearsal on a copy	Checks every field and rule before anything is created or changed
Application	Next.js 16, React 19, TypeScript, Node 22	One shared engine that renders every business
Hosting and CI/CD	Cloud Run (asia-southeast1), Cloud Build	Container deploys that scale to zero when idle
Data	Cloud SQL for PostgreSQL 17, Kysely	Workspaces, records, versions, history, teams and community systems
Files and secrets	Cloud Storage, Secret Manager	Uploaded images and QR codes; database and auth credentials
Auth	Better Auth	Email and password or Google sign-in, sessions, owner/admin/staff/viewer roles
Interface and quality	Tailwind CSS 4, shadcn/ui, MDXEditor, Konva; Vitest, Biome	Workspace views, editors and canvas; automated tests and linting

Estimated implementation cost (optional)

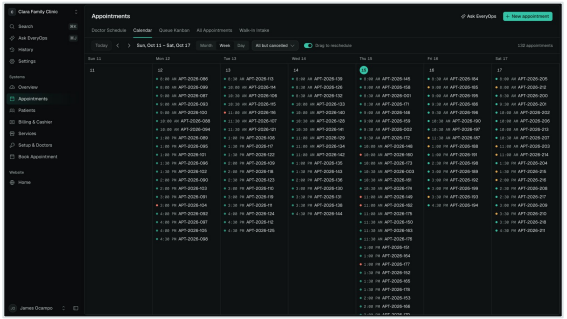

Item	Basis (list price)	Pilot estimate / month
Cloud Run (1 vCPU, 1 GiB, max 3 instances)	Billed per use; scales to zero when idle; free monthly tier	≈ $0–15
Cloud SQL for PostgreSQL 17 (db-f1-micro, 10 GB)	$0.0105 per hour in asia-southeast1, plus storage	≈ $9–10
Gemini 3.5 Flash: workspace design	$1.65 in / $9.90 out per 1M tokens; 12–16k output tokens per design	≈ $0.15–0.20 per design
Gemini 3.7 Flash: questions and Ask EveryOps	$0.75 in / $3.75 out per 1M tokens (global, to Dec 31, 2026)	≈ $0.01 per reply
Cloud Storage, Secret Manager, Cloud Build	Light usage	≈ $1–5
Pilot total: 50 businesses	50 designs, 500 setup answers, 2,000 Ask EveryOps replies	≈ $55–70

Estimates from Google Cloud list prices, excluding taxes and network egress. One shared engine means no new code or hosting per business, so cost grows mainly with AI usage, which is capped per user (30 requests per 10 minutes).

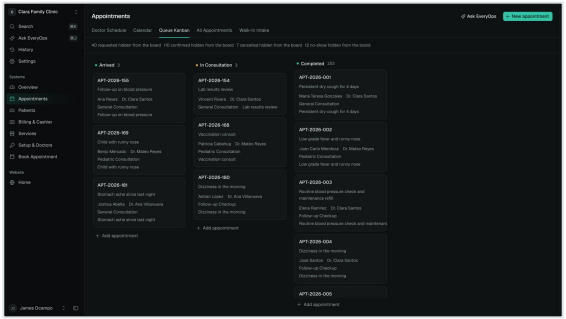

Snapshots of the prototype

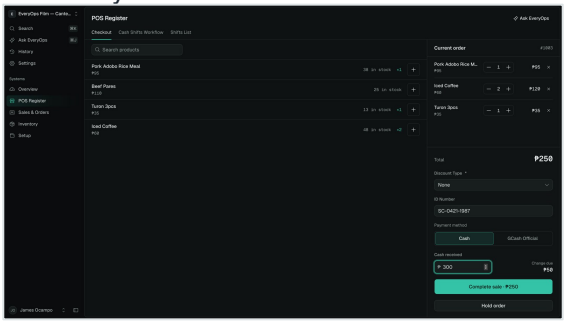

Describe it A family clinic in Cebu. Gemini asks only what it needs.

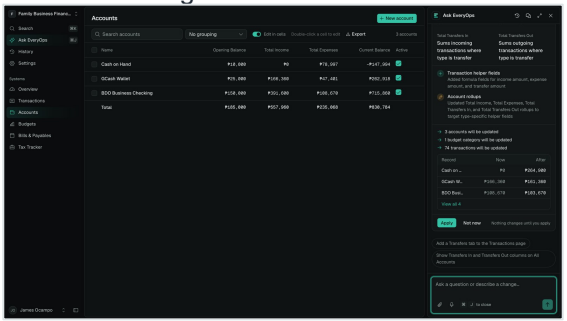

Live doctor schedules Month, week or day; double bookings are blocked.

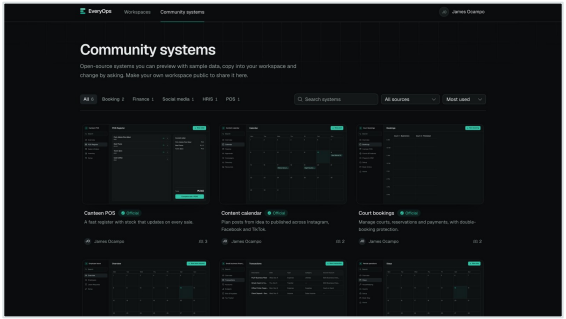

Front-desk queue Patients move from arrived to consultation to done.

Canteen point of sale Discounts, cash and change; every sale updates stock.

Ask EveryOps Gemini proposes a fix and previews balances before and after.

Community systems Preview a shared system or copy it in one click.

Prototype Performance report/Benchmarking

Check (2026-10-15)	Result
Automated engine tests (Vitest)	375 tests across 65 files passed; typecheck, lint and production build passed
Ask EveryOps evaluation, real Gemini 3.7 Flash	16/16 cases passed (Taglish, filters, exact totals, safe deletes); median 13.1 s, slowest 29.8 s
Setup design evaluation	11/11 structure and requirement checks passed in 33.9 s
Multi-part change preservation	3/3 repeated runs passed
AI-built customer websites	3/3 cases produced working pages in 42–63 s
Design time by model	Same finance brief: 47 s on Gemini 3.5 Flash vs 92 s on 3.7 Flash, so designs run on 3.5
Browser checks	Desktop (1440 and 1710 px) and mobile (390 × 844): setup, apply, undo, public booking

Local app with an isolated PostgreSQL database, sample data and real Vertex AI calls. These are regression checks, not a production accuracy benchmark.

Impact and scalability

Impact

- **No developer needed.** Owners turn how they already work into a system the whole team can use.
- **From months to a conversation.** A working workspace with sample data, instead of a long custom build.
- **Keeps up with the business.** New prices, fields or rules by asking; every change previewed and reversible.
- **Pilot measures:** time to a usable workspace, duplicate data entry, task completion time. These are targets, not results yet.

Scalability

- **One engine for every business.** A new business adds a blueprint and records, not new code or a new deployment.
- **Any kind of operation.** Clinics, canteens, courts, stays, salons, repair shops, agencies and accounting on the same building blocks.
- **Elastic on Google Cloud.** Cloud Run autoscaling, Cloud SQL, per-user AI limits and timeouts.
- **Grows with the community.** Every shared system becomes a starting point and reference for the next business.

Additional Details/Future Development (if any)

Product roadmap

- **Developer access.** API keys, an MCP server and a REST/OpenAPI interface.
- **Integrations.** Webhooks, data imports and sync, and connections to outside tools.
- **Automations and activity log.** Scheduled and event-driven actions with a full audit trail.
- **Custom domains.** Each business's customer website on its own domain.
- **Payments.** Real payment settlement for bookings and sales.

Production readiness and pilot

- **Reliability.** Load and concurrency testing, database capacity tuning, backup and recovery drills.
- **Operations.** Monitoring, alerting and AI cost budgets.
- **AI quality.** Broader evaluations with real owners and workflows.
- **Pilot.** Onboard small businesses in Cebu and measure time saved and data quality.
